

NOT π VISION

Plan By: **Sabir Ali Mondal**

Problem Statement

- **Traditional study materials are static and text-heavy.**
- Students struggle with complex/abstract concepts without visuals.
- Teachers lack quick, affordable tools for dynamic aids.
- **No alternative to PPT study or Video editing for visualize .**
- Low-resource regions lack access to powerful devices or EdTech.

Solution Overview

- Lightweight, frontend powered AI tool.
- Syllabus/text topics into interactive 2D/3D visuals.
- Presentation: **Visuals, slides, and voice narrations like podcast.**
- Runs on any devices via browser.
- Visualization styles: Scientific, Mindmap, Graph, Blueprint etc.

GitHub : <https://github.com/Sabir-Ali-Mondal/Not-Pi-Vision/tree/main/NPVision-3.0>

Features

- Standard Features (Ordinary but Essential):
 - Workspace management
 - Responsive UI
 - Offline storage (Indexed DB)
 - Text-to-Speech with highlighting
- **Unique Features (Stand-out Innovations):**
 - AI syllabus deconstruction (raw text → structured Units/Chapters/Topics)
 - **Output (Text + Visualization with podcast + Slides)**
 - Integrated dual-panel viewer (visualization + content together)
 - **Smart image linking (auto Google search suggestions)**
 - Self-contained & serverless (no external storage)

Comparison: Not Pi Vision vs Traditional AI Tools

Feature	Not Pi Vision (Code-Based Visuals)	Traditional AI Tools (Static Media)
Visual Generation	Live visuals via code. HTML/JS (fast, flexible)	Generates videos/images (slow, static)
Experience	Dynamic 2D/3D, interactive	Often cartoonish or ultra realistic
Ease of Use	One-click, no heavy setup	Requires editing and re-rendering
Performance	Runs on low-end devices, browser-only	Needs high compute and strong internet
Technology	Pure frontend (HTML/JS/CSS, p5.js) Optional Backend	Cloud-based, GPU-heavy

Comparison: Not Pi Vision vs Video Generation AI

Aspect	Not Pi Vision (Code)	Video Generation AI
Time to Generate	Instant (1–2 minutes)	High (30 minutes+)
Energy/Compute Use	Very Low (text output only)	Very High (GPU rendering)
Precision for Learning	Math/science/Graph accurate visuals	Artistic, often imprecise
Style Control	Full control (colours, lines, shapes)	Limited control (depends on model style)
Interactivity	Fully interactive via JS/canvas	None (static playback)
File Size	Small (few KBs of code)	Large (MBs of video files)
Post-Editing	Easy (edit code, instant change)	Hard (requires re-rendering)
Best for Academic Diagrams	Yes	No (blurry, not structured)

OpenAI API Integration

Prompt Generation – App creates a master prompt then sends request to AI model .

- Frontend Method – Opens ChatGPT in a new tab with the prompt auto filled:

```
window.open(`https://chatgpt.com/?q=${encodeURIComponent(prompt)}`, '_blank');
```

- Backend Option – Higher models can be integrated via API using a Node.js backend.

Execution and Scaling Plan

- High-fidelity code generation for p5.js simulations.
- Improved visual and narration scripts.
- Less failure ratio.
- **Personalized Q&A tutoring with live streaming AI.**

Already so many features are implemented and developing .

Future Vision

- Global adoption starting with India-like low-resource regions.
- Enhanced 2D, 3D, Video, VR integration for institutions.
- Collaboration and co-creation features.
- Continuous evolution .
- *ChatGPT-like chatbots can provide visualizations through frontend-powered code, making interactive visual responses accessible to non-developers directly within the chat interface.*
